The structure and properties of cellular solids have fascinated scientists and engineers for centuries. Modern imaging and analysis techniques allow their properties to be understood in greater detail. The range of materials from which cellular solids can be made is constantly increasing, allowing new applications such as the

Mechanics of filled cellular materials

The factors influencing the mechanical properties of a cellular material are the apparent density, defined as the ratio between the density of the cellular solid and the density of the material, the internal architecture and the material properties of the microstructure In its most sophisticated form, natural cellular materials are even

Mechanical properties of cellular materials

Materials with cellular structure occur widely in nature This seminar discusses the mechanical models of two and three dimensional cellular solids We introduce the honeycomb-like structure of wood and the foam-like structure of the trabecular bone The third example of cellular material, glass sponge *Euplectella* sp, is presented as well 1

The mechanical properties of metal foams (and other cellular solids) depend on the properties of the metal that they are made from, on their relative density, and on the cell topology (ie, cell size, cell shape, open or closed cell morphology, etc) The cell size of commercially available metal foams is about 1 to 10 mm This is on the order
